[

$$\Delta P = f \times \frac{L}{D} \times \frac{\rho V^2}{2}$$

]

where:

- f = Darcy friction factor
- L = length of pipe
- ρ = fluid density
- V = flow velocity

Designers optimize diameter and flow velocity to minimize energy costs while maintaining system efficiency.

3. Thermal Expansion and Contraction

Temperature variations induce expansion or contraction:

\[

$$\Delta L = \alpha \times L \times \Delta T$$

\]

where:

- α = coefficient of thermal expansion
- L = initial length
- ΔT = change in temperature

Designs incorporate expansion loops and flexible joints to accommodate these changes.
