Question What are the main differences between the skeletal structures of fish and mammals in Bio 201 Comparative Anatomy? Fish typically have a cartilaginous or bony endoskeleton with a streamlined skull and fins, whereas mammals have a more complex skeleton with a differentiated skull, vertebral column, and limb bones adapted for land movement and support. How does the respiratory system differ between amphibians and reptiles in comparative anatomy? Amphibians primarily use skin and lungs for respiration, with some relying heavily on

cutaneous respiration, while reptiles have well-developed lungs with more extensive internal septa, enabling more efficient air exchange suited for terrestrial life. In Bio 201, what is the significance of the comparison between the muscular systems of birds and mammals? Both birds and mammals have well-developed musculature for locomotion, but birds have specialized pectoral muscles for flight, such as the supracoracoideus and pectoralis, whereas mammals have diverse muscle groups adapted for walking, running, and other movements. What are the key differences in the digestive systems of herbivorous and carnivorous animals studied in comparative anatomy? Herbivores tend to have longer intestines and specialized structures like cecum to digest cellulose, while carnivores have shorter digestive tracts optimized for rapid digestion of protein and fat, with a more developed stomach for meat digestion. How does the structure of the brain vary among different vertebrates in Bio 201 Comparative Anatomy? Brain structure varies significantly; for example, fish have a relatively simple brain with less developed cerebral hemispheres, whereas mammals possess highly developed cerebral cortexes enabling complex behaviors, sensory processing, and higher functions. What are the evolutionary adaptations observed in the limb bones of tetrapods? Tetrapod limb bones show adaptations like the development of the humerus, radius, and ulna for weight-bearing and movement on land, with modifications such as webbed feet in aquatic species or specialized digits in terrestrial animals. In comparative anatomy, how do the reproductive organs of monotremes differ from those of placental mammals? Monotremes, like the platypus, lay eggs and have cloacae, whereas placental mammals have internal fertilization, a complex placenta for nutrient exchange, and separate urinary and reproductive tracts. What is the significance of the notochord in early vertebrate development as studied in Bio 201? The notochord provides structural support during early development and is a precursor to the vertebral column in most vertebrates; it also plays a role in signaling for the development of the nervous system. How do the circulatory systems of amphibians and mammals compare in terms of structure and function? Amphibians have a three-chambered heart with a mixing of oxygenated and deoxygenated blood, suitable for their dual life, whereas mammals have a four-chambered heart that completely separates oxygenated and deoxygenated blood for efficient circulation. What are the major differences in the sensory organs of aquatic versus terrestrial vertebrates in Bio 201? Aquatic vertebrates often have lateral line systems and specialized eyes for underwater vision, while terrestrial vertebrates have well-developed lungs, external ears, and more complex visual and olfactory organs adapted for air-based environments.
