Overview of Prentice Hall Foundations Geometry Section 11-4

What is Covered in Section 11-4?

Section 11-4 typically focuses on the properties of circles and their related segments, including:

- Arc measures and their relationships with central and inscribed angles
- Theorems involving chords, tangents, and secants
- Calculations of arc lengths and sector areas
- Applications of the Angle Properties of Circles

Understanding these core concepts is crucial for solving problems efficiently and accurately.

Key Concepts to Master

Before diving into specific answers, it's important to have a grasp of the following concepts:

- Central angles and their intercepted arcs
- Inscribed angles and their relationships with arcs
- Chord properties and their angles
- Tangent and secant line properties
- Arc length and sector area calculations

Detailed Answers to Prentice Hall Foundations Geometry 11-4 Exercises

Question 1: Calculating Arc Measures

Problem Statement:

In circle O, the measure of a central angle is 70° . Find the measure of its intercepted arc.

Answer:

The measure of the intercepted arc is equal to the measure of the central angle. Therefore:

Solution:

$$\text{Arc measure} = \text{Central angle measure} = 70^\circ$$

Explanation:

By the definition of a central angle, the arc it intercepts measures exactly the same as the angle itself.

Question 2: Inscribed Angles and Arcs

Problem Statement:

In circle P, an inscribed angle measures 40° , and it intercepts an arc. What is the measure of the intercepted arc?

Answer:

The measure of an inscribed angle is half the measure of its intercepted arc.

Solution:

$$\text{Arc measure} = 2 \times \text{inscribed angle} = 2 \times 40^\circ = 80^\circ$$

Explanation:

This follows from the Inscribed Angle Theorem, which states that an inscribed angle measures half the measure of the intercepted arc.

Question 3: Chord Properties and Angles

Problem Statement:

In circle Q, two chords AB and CD intersect at point E inside the circle. If $\angle AEB$ measures 60° , find the measure of the angle $\angle CED$ formed by the intersecting chords.

Answer:

The measure of angle $\angle CED$ can be found using the "angle formed by two intersecting chords" theorem.

Solution:

- The measure of an angle formed by two intersecting chords is half the sum of the measures of the intercepted arcs.
- Alternatively, the measure of the angle equals half the sum of the measures of the intercepted arcs.

Assuming the arcs intercepted are known or can be deduced, the general formula is:

$$\text{Angle measure} = \frac{1}{2} (\text{arc1} + \text{arc2})$$

Since specific arc measures are not provided, the general answer is:

$$\angle CED = \frac{1}{2} (\text{measure of arc intercepted by chords CE and ED})$$

Question 4: Tangent and Secant Line Theorem

Problem Statement:

A tangent and a secant are drawn from an external point T to circle R. If the length of the tangent segment is 8 units and the secant segment from T passing through the circle has external part 3 units and total length 15 units, find the length of the secant segment inside the circle.

Answer:

Using the tangent-secant theorem,

Solution:

- The length of the tangent segment = 8 units
- The external part of the secant = 3 units
- Total secant length from T to the far point of intersection = 15 units

The length of the secant segment inside the circle:

Inside segment = total length - external part = $15 - 3 = 12$ units

Explanation:

The Power of a Point theorem states that the square of the tangent segment equals the product of the external and internal segments of the secant:

$$-(\text{Tangent})^2 = (\text{external} \backslash \text{secant}) \times (\text{full} \backslash \text{secant})$$

Check:

- $8^2 = 64$
- $3 \times 12 = 36$

In this case, the numbers suggest the need to verify or adjust based on the problem specifics; however, given the data, the inside secant segment is 12 units.
