Detailed Solutions and Strategies for Key Questions

Below, we present a detailed walkthrough of typical questions from the Unit IV 2 section, along with step-by-step solutions and explanations.

Question 1: Formulate a Differential Equation for Population Growth

Scenario:

A population of bacteria grows in a nutrient-rich environment. The growth rate is proportional to the current population, but resources become limited as the population reaches a maximum capacity.

Solution Approach:

This scenario suggests a logistic growth model.

Step-by-Step Solution:

- Define Variables:

Let $P(t)$ be the population at time t .

- Identify Growth Rate:

The growth rate is proportional to the population, so:

$$\frac{dP}{dt} = rP$$

- Incorporate Limiting Factors (Carrying Capacity):

As resources become limited, the growth slows down as P approaches maximum capacity K .

Thus, the logistic model is:

\[

$$\frac{dP}{dt} = r P \left(1 - \frac{P}{K} \right)$$

\]

Answer:

The differential equation modeling the population is:

\[

$$\boxed{\frac{dP}{dt} = r P \left(1 - \frac{P}{K} \right)}$$

\]

Question 2: Solve the Logistic Differential Equation

Given:

\[

$$\frac{dP}{dt} = r P \left(1 - \frac{P}{K} \right)$$

\]

Initial Condition:

Suppose \(\ P(0) = P_0 \ \).

Solution Approach:

Use separation of variables.

Step-by-Step Solution:

- Rewrite the Equation:

$$\left[\right.$$

$$\frac{dP}{dt} = r P \left(1 - \frac{P}{K} \right)$$

$$\left. \right]$$

- Separate Variables:

$$\left[\right.$$

$$\frac{dP}{P (1 - P/K)} = r dt$$

$$\left. \right]$$

- Partial Fraction Decomposition:

Express the left side as:

$$\left[\right.$$

$$\frac{1}{P (1 - P/K)} = \frac{A}{P} + \frac{B}{1 - P/K}$$

$$\left. \right]$$

Solve for A and B :

$$\left[\right.$$

$$1 = A \left(1 - \frac{P}{K} \right) + B P$$

$$\left. \right]$$

Set $P = 0$:

$$\left[\right.$$

$$1 = A \rightarrow A = 1$$

$$\left. \right]$$

Set $(P = K)$:

[

$$1 = B K \rightarrow B = \frac{1}{K}$$

]

So,

[

$$\frac{1}{P(1 - P/K)} = \frac{1}{P} + \frac{1}{K - P}$$

]

- Integrate Both Sides:

[

$$\int \left(\frac{1}{P} + \frac{1}{K - P} \right) dP = \int r dt$$

]

[

$$\ln |P| - \ln |K - P| = r t + C$$

]

- Solve for $(P(t))$:

[

$$\ln \left| \frac{P}{K - P} \right| = r t + C$$

]

[

$$\frac{P}{K - P} = C' e^{rt}$$

\]

where $C' = e^{-C}$.

- Express $P(t)$:

\[

$$P(t) = \frac{K C' e^{rt}}{1 + C' e^{rt}}$$

\]

- Apply Initial Condition:

At $t=0$:

\[

$$P(0) = P_0 = \frac{K C'}{1 + C'}$$

\]

Solve for C' :

\[

$$C' = \frac{P_0}{K - P_0}$$

\]

Final Solution:

\[

\boxed{

$$P(t) = \frac{K \cdot \frac{P_0}{K - P_0} e^{rt}}{1 + \frac{P_0}{K - P_0} e^{rt}} = \frac{K P_0 e^{rt}}{K - P_0 e^{rt}}$$

$$-P_0 + P_0 e^{rt}$$

}

\]

Question 3: Model the Cooling of an Object

Scenario:

An object cools in a surrounding environment at a rate proportional to the temperature difference.

Given:

Initial temperature $(T(0) = T_0)$, ambient temperature (T_a) , and cooling constant (k) .

Differential Equation:

\[

$$\frac{dT}{dt} = -k(T - T_a)$$

\]

Solution Approach:

This is a first-order linear differential equation.

Step-by-Step Solution:

- Separate variables:

\[

$$\frac{dT}{T - T_a} = -k dt$$

\]

- Integrate both sides:

\[

$$\ln |T - T_a| = -k t + C$$

\]

- Express the solution:

\[

$$T(t) = T_a + C' e^{-k t}$$

\]

- Apply initial condition:

\[

$$T(0) = T_0 = T_a + C' \rightarrow C' = T_0 - T_a$$

\]

Final solution:

\[

\boxed{\

$$T(t) = T_a + (T_0 - T_a) e^{-k t}$$

\}

\]

Breakdown of Key Questions and Their Answers in Unit IV 2

Question 1: Formulating the Mathematical Model

Problem Statement:

Given a scenario involving the growth of a bacterial population with specific constraints, students are tasked with formulating an appropriate mathematical model.

Typical Approach:

- Identifying key variables (e.g., population size, time)
- Recognizing the growth pattern (exponential, logistic, etc.)
- Incorporating constraints such as carrying capacity or resource limitations

Sample Answer:

A common model is the logistic growth model:

$$P(t) = \frac{K}{1 + Ae^{-rt}}$$

where:

- $P(t)$ is the population at time t
- K is the carrying capacity
- r is the intrinsic growth rate
- A is a constant determined by initial conditions

Discussion:

The answer involves setting initial conditions to solve for A , and understanding how parameters influence growth dynamics. Correct formulation is crucial, as it underpins all subsequent analysis.

Question 2: Solving the Model and Analyzing Behavior

Problem Statement:

Using the formulated model, students calculate specific values and analyze long-term behavior.

Typical Approach:

- Substituting known initial data to find constants

- Deriving the equilibrium points
- Analyzing the stability of the model

Sample Answer:

Suppose initial population (P_0) is known; then:

$$P_0 = \frac{K}{1 + A} \Rightarrow A = \frac{K - P_0}{P_0}$$

The long-term behavior is determined by the limit as $(t \rightarrow \infty)$:

$$\lim_{t \rightarrow \infty} P(t) = K$$

Discussion:

This demonstrates that, over time, the population approaches the carrying capacity, illustrating natural saturation.

Question 3: Interpretation and Real-World Implications

Problem Statement:

What do the mathematical results imply about the biological scenario? How can these insights inform practical decisions?

Sample Answer:

The model indicates that bacterial growth will stabilize at the environment's maximum capacity, preventing indefinite exponential increase. This understanding can help in designing containment strategies or optimizing resource allocation in bioreactors.

Discussion:

Interpreting the model's predictions in real terms encourages students to appreciate the relevance of mathematical tools in decision-making processes.
