This architecture ensures high reliability, critical for long-haul flights where system failures can have significant safety implications.

Core Functions and Capabilities

Flight Planning and Route Management

Pilots input their planned route into the FMC, including waypoints, airways, arrival and departure procedures, and restrictions. The system automatically calculates the most efficient profile and checks for conflicts or errors.

Navigation and Positioning

Using inputs from:

- Inertial Navigation Systems (INS)
- GPS (Global Positioning System)
- VOR, DME, and other navigational aids

the FMC continuously computes the aircraft's position, updating it with high accuracy throughout the flight.

Performance Optimization

The FMC calculates:

- Takeoff and landing distances
- Climb, cruise, and descent performance
- Fuel consumption estimates
- Weight and balance considerations

This helps pilots make informed decisions and adjust flight parameters accordingly.

Autopilot and Auto-throttle Integration

By interfacing with the aircraft's autopilot and autothrottle systems, the FMC automates:

- Course changes
- Speed adjustments
- Altitude changes
- Descent and climb profiles

This integration reduces pilot workload significantly, especially during complex phases of flight.

Monitoring and Alerts

The FMC constantly monitors system health and flight parameters, issuing alerts for:

- Deviations from planned route
- System failures
- Potential conflicts or hazards
