Step-by-Step Example: Analyzing a R404A Refrigeration Cycle

Let's walk through a typical cycle analysis:

Step 1: Evaporator Outlet (Suction Line)

- Known: Saturated vapor at low pressure ($\sim -10^{\circ}\text{C}$, 2.5 bar)

- On the diagram: Locate the saturated vapor line at 2.5 bar, identify enthalpy and entropy.

Step 2: Compressor Inlet

- Slightly superheated vapor may be observed.
- Use the superheated region to find the actual state point.

Step 3: Compressor Outlet

- Higher pressure (~12 bar) and temperature.
- Move along the constant pressure line to the high-pressure side, noting enthalpy increase.

Step 4: Condenser Outlet

- Refrigerant condenses to saturated liquid at high pressure.
- Locate the saturated liquid line at 12 bar (~45°C).

Step 5: Expansion Valve

- The refrigerant expands to the evaporator pressure, entering the evaporator as a mixture with some quality.
- Use the quality lines to determine the vapor-liquid ratio.

By analyzing these points on the Mollier diagram, engineers can verify if the system operates optimally or identify issues needing correction.
