Problem:

A car accelerates uniformly from a speed of 20 m/s to 40 m/s over a distance of 200 m. Find the acceleration and the time taken for this journey.

Solution:

Step 1: Identify knowns and unknowns.

- Initial velocity, $u = 20 \text{ m/s}$
- Final velocity, $v = 40 \text{ m/s}$
- Distance, $s = 200 \text{ m}$
- Acceleration, $a = ?$
- Time, $t = ?$

Step 2: Use the equation of motion:

$$v^2 = u^2 + 2as$$

$$v^2 = u^2 + 2as$$

$$40^2 = 20^2 + 2a(200)$$

Step 3: Solve for a :

$$1600 = 400 + 400a$$

$$a = \frac{v^2 - u^2}{2s} = \frac{(40)^2 - (20)^2}{2 \times 200} = \frac{1600 - 400}{400} = \frac{1200}{400} = 3, \text{ m/s}^2$$

\\

Step 4: Find time (t):

Using (v = u + at):

\\

$$t = \frac{v - u}{a} = \frac{40 - 20}{3} = \frac{20}{3} \approx 6.67, \text{ s}$$

\\

Final Answer:

PHYSICS NOTES 12 SCIENCE GRAVITATION CHAPTER

physics notes 12 science gravitation chapter is an essential resource for students studying class 12 science, particularly those preparing for competitive exams and board examinations. This chapter delves into the fundamental forces that govern the universe, exploring the nature of gravity, its laws, and applications. Understanding gravitation is crucial for comprehending the motion of planets, satellites, and other celestial bodies, as well as various phenomena on Earth. This comprehensive guide aims to provide detailed notes on the chapter, optimized for SEO, to help students grasp the core concepts and ace their exams.

Introduction to Gravitation

Gravitation is one of the four fundamental forces of nature, responsible for the attractive force between objects with mass. It plays a pivotal role in the structure and behavior of the universe, from the motion of planets around stars to the falling of objects on Earth. The chapter on gravitation covers various aspects including Newton's law of universal gravitation, acceleration due to gravity, gravitational potential energy, and the orbital motion of celestial bodies.

Newton's Law of Universal Gravitation

Newton's law of universal gravitation states that every point mass attracts every other point mass in the universe with a force that is directly proportional to the product of their masses and inversely proportional to the square of the distance between them.

Mathematical Expression

The law can be mathematically expressed as:

$$F = G \frac{m_1 m_2}{r^2}$$

Where:

- (F) = magnitude of the gravitational force between two objects
- (G) = universal gravitational constant ($(6.674 \times 10^{-11} \text{ Nm}^2/\text{kg}^2)$)
- (m_1, m_2) = masses of the objects
- (r) = distance between the centers of the two masses

Key Points of Newton's Law

- The force is attractive and acts along the line joining the centers of the two masses.
- The gravitational force is mutual; both objects attract each other equally.
- The law explains the planetary motions, tides, and other celestial phenomena.

Acceleration Due to Gravity (g)

The acceleration due to gravity at a point on the Earth's surface is the acceleration experienced by an object freely falling under gravity.

Expression for g

[

$$g = G \frac{M}{R^2}$$

]

Where:

- (M) = mass of the Earth ($(5.972 \times 10^{24} \text{ kg})$)
- (R) = radius of the Earth ($(6.371 \times 10^6 \text{ m})$)

Variation of g

- The value of (g) decreases with altitude and depth.
- At the surface, the standard value of (g) is approximately (9.8 m/s^2) .
- (g) varies slightly with location due to Earth's shape and density variations.

Universal Law of Gravitation and Kepler's Laws

Understanding the connection between Newton's law and Kepler's laws helps explain planetary motion.

Kepler's Laws

- First Law: Planets move in elliptical orbits with the Sun at one focus.
- Second Law: A line segment joining a planet and the Sun sweeps out equal areas during equal intervals of time.
- Third Law: The square of the orbital period of a planet is proportional to the cube of the semi-major axis of its orbit:

\[

$$T^2 \propto r^3$$

\]

Derivation from Newton's Law

- Newton's law of gravitation explains Kepler's third law mathematically, linking the orbital period and radius.

Gravitational Potential Energy and Escape Velocity

Understanding energy concepts related to gravitation is vital for comprehending satellite launches and celestial mechanics.

Gravitational Potential Energy (GPE)

\[

$$U = -G \frac{m_1 m_2}{r}$$

\]

- Negative sign indicates that energy must be supplied to overcome the gravitational attraction

and escape.

Escape Velocity

- The minimum velocity required for an object to escape Earth's gravitational pull without further propulsion:

$$v_e = \sqrt{2 G \frac{M}{R}} \approx 11.2 \, \text{km/s}$$

- Critical for space missions and satellite deployment.

Orbital Motion and Satellite Mechanics

Satellites orbit Earth due to gravitational force providing the necessary centripetal force.

Conditions for Circular Orbit

$$\text{Centripetal force} = \text{Gravitational force}$$

$$\frac{mv^2}{r} = G \frac{mM}{r^2}$$

- Solving for velocity:

$$v = \sqrt{G \frac{M}{r}}$$

\]

Types of Satellite Orbits

- Geostationary Orbit: Satellite remains fixed relative to a point on Earth's surface.
- Polar Orbit: Passes over the poles; used for Earth observation.
- Low Earth Orbit (LEO): For communication and reconnaissance.

Gravity and Its Applications

The understanding of gravitation has numerous practical applications.

Applications in Daily Life and Technology

- Designing satellites and space missions.
- Predicting tides and oceanography.
- Geophysical surveys and mineral exploration.
- Understanding planetary and stellar evolution.

Earth's Tides

- Caused by the gravitational pull of the moon and the sun.
- The moon's gravitational attraction causes the water to bulge, creating high tides.

Key Points to Remember

- Universal gravitational constant (G) is a fundamental constant of nature.
- Newton's law explains planetary motions and celestial phenomena.
- The acceleration due to gravity varies with altitude and depth.
- Escape velocity is approximately 11.2 km/s for Earth.
