- Security and User Management
- Integration with various data sources

Basic OBIEE Interview Questions and Answers

- What are the main components of OBIEE?

Answer:

OBIEE comprises several core components, including:

- Oracle BI Server: The core component that handles query generation, execution, and data retrieval.
- Oracle BI Presentation Layer: Manages the user interface, reports, dashboards, and prompts.
- Oracle BI Repository (RPD): Metadata repository that defines the logical and physical data models.
- Oracle BI Scheduler: Automates report and dashboard delivery.

- Oracle BI Dashboards: Visual interface to display reports and KPIs.
- Oracle BI Agents: Monitors system health and triggers alerts.

- What is the purpose of the Repository (RPD) in OBIEE?

Answer:

The RPD (Repository) is a metadata file that contains the logical and physical data models. It defines how data from various sources is mapped, organized, and presented within OBIEE. The RPD acts as a bridge between physical data sources and the presentation layer, enabling users to perform analysis without needing to understand underlying data complexities.

- Explain the difference between Physical Layer, Business Model Layer, and Presentation Layer in OBIEE.

Answer:

- Physical Layer: Represents the actual data sources, like tables, views, or external databases. It defines the physical database objects.

- Business Model Layer: Provides an abstracted, logical view of the data. It includes logical tables, columns, and joins, simplifying complex physical data for end-users.

- Presentation Layer: The user-facing layer where logical columns and tables are organized for reporting and analysis. It presents a user-friendly view of data.

- What are the different types of joins in OBIEE?

Answer:

OBIEE supports various join types, including:

- Inner Join: Returns records with matching values in both tables.

- Outer Join (Left, Right, Full): Returns all records from one table and matched records from the other.

- Compound Join: Combines multiple join conditions.

- Complex Join: Used for many-to-many relationships.

Advanced OBIEE Interview Questions and Answers

- What is a Logical Table Source (LTS) in OBIEE?

Answer:

A Logical Table Source (LTS) is a logical representation of data in the Business Model Layer that

maps to one or more physical sources in the Physical Layer. It allows multiple physical sources to combine into a single logical table, enabling data from different sources to be used seamlessly in reports.

- How do you handle complex joins in OBIEE?

Answer:

Complex joins are used when simple joins can't handle many-to-many relationships or advanced join conditions. To handle complex joins:

- Use complex join in the Physical Layer to specify join conditions.
 - Set the join type (e.g., inner, outer).
 - Adjust the join cardinality to reflect data relationships.
 - Validate the join logic through test queries.
-
- What is the purpose of the 'Repository' in OBIEE, and how do you modify it?

Answer:

The Repository (RPD) is the metadata layer that defines data sources, logical models, and presentation structures. To modify it:

- Open the RPD file in Oracle BI Administration Tool.
- Use the Physical Layer to add or modify data sources.
- Update the Business Model Layer to create or modify logical models.
- Refresh or rebuild the Presentation Layer as needed.
- Save changes and deploy the RPD to the server.

- What are the different types of filters in OBIEE?

Question What is OBIEE and what are its main components? OBIEE (Oracle Business Intelligence Enterprise Edition) is a comprehensive suite of enterprise business intelligence tools. Its main components include BI Server (logical data access layer), BI Presentation Layer (user interface), BI Scheduler (report scheduling), BI Answers (ad-hoc reporting), BI Dashboards (visual dashboards), and BI Publisher (report publishing). **How does the OBIEE architecture work?** OBIEE architecture involves multiple layers: Data sources (databases), the BI Server which processes requests and manages logical data modeling, the Presentation Layer for user interaction, and the Web Server that hosts the BI portal. Users create reports and dashboards that query data through the BI Server, which retrieves and processes data from underlying sources. **What is a Repository (RPD) in OBIEE and how is it structured?** The RPD (Repository) is a metadata repository that defines logical data models, physical data sources, and security settings. It has three main layers: Physical Layer (connects to data sources), Business Model and Mapping Layer (logical models of data), and Presentation Layer (user-visible objects). **Explain the difference between a Logical Table and a Physical Table in OBIEE.** A Physical Table represents the actual table in the database, while a Logical Table is an abstraction used in the Business Model layer to define how data is presented to users. Logical Tables are mapped to Physical Tables and can combine data from multiple sources. **What are aggregate tables in OBIEE, and why are they used?** Aggregate tables contain pre-summarized data at various levels of aggregation. They improve query performance by reducing

the amount of data processed during report execution, especially for large datasets or complex calculations. How do you troubleshoot performance issues in OBIEE? Troubleshooting involves analyzing query logs, using the BI Server Diagnostics, checking for inefficient SQL queries, optimizing the RPD, creating aggregate tables, tuning the database, and reviewing report design for performance bottlenecks. What is a Prompt in OBIEE and how is it used? A Prompt is an interactive filter that allows users to select values dynamically at runtime, which then filters the data displayed in reports or dashboards. Prompts enhance report interactivity and user control over data views. Can you explain the difference between 'Session Variables' and 'Repository Variables' in OBIEE? Repository Variables are static variables defined in the RPD used for configuration or setting default values. Session Variables are dynamic variables set at runtime for individual user sessions, often used to personalize reports or control access.
