$$L = T - V$$

\]

where L is the Lagrangian, T is kinetic energy, and V is potential energy.

The equations of motion derived from the Lagrangian are expressed as:

\[

$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_i} \right) - \frac{\partial L}{\partial q_i} = \tau_i$$

\]

where q_i are joint variables, $\dot{q}_i$ are their derivatives, and τ_i are joint torques.

            0.5, 0.2, 0.3]; % Return position

% Generate joint configurations for path

[q, qd] = ikinePath(robot, waypoints);

% Animate the robot along the path

for i = 1:length(q)

show(robot, q(:, i), 'Frames', 'off', 'PreservePlot', false);

drawnow;

This script demonstrates path interpolation and visualization, enabling developers to verify motion plans before physical implementation.

## Control System Design Using MATLAB

Control is the core of robotic operation, enabling precise movement, obstacle avoidance, and adaptive behaviors. MATLAB provides powerful tools for designing, tuning, and implementing control algorithms.

### Inverse Kinematics

Inverse kinematics computes the joint angles needed to reach a desired end-effector position and orientation. MATLAB's `inverseKinematics` class simplifies this task:

```
```matlab
```

```
ik = inverseKinematics('RigidBodyTree', robot);  
  
[configSol, info] = ik(endEffector, targetPose, weights, initialGuess);  
  
...
```

This allows for real-time computation of joint configurations necessary to achieve target poses.

Trajectory Planning

Smooth and collision-free trajectories are vital for efficient robot operation. MATLAB offers functions such as:

- ``trapveltraj`` for trapezoidal velocity profiles.
- ``cscvn`` for spline-based smooth paths.
- Custom algorithms for obstacle avoidance.

Controller Design

Common controllers include:

- PID Controllers: For basic position and velocity control.
- Model Predictive Control (MPC): For complex, constrained motion planning.
- Adaptive and Robust Controllers: To handle uncertainties and disturbances.

MATLAB's Control System Toolbox and Model Predictive Control Toolbox facilitate the design and simulation of these controllers, which can then be deployed onto physical robots.

Hardware Integration and Deployment

MATLAB's versatility shines in bridging simulation and physical implementation. It supports direct hardware interfacing through:

- Arduino and Raspberry Pi Support Packages: Enable programming and control of small-scale robots.
- ROS (Robot Operating System) Support: For advanced robot systems, MATLAB can connect to ROS networks, allowing real-time data exchange and control.
- Code Generation: MATLAB Coder and Simulink Coder generate optimized C/C++ code suitable

for deployment on embedded controllers.

Example: Sending Commands to a Robot

```
```matlab

% Connect to ROS network

rosinit;

% Create publisher for joint commands

jointPub = rospublisher('/joint_commands', 'sensor_msgs/JointState');

% Create message

msg = rosmessage(jointPub);

msg.Name = {'joint1', 'joint2', 'joint3', 'joint4', 'joint5', 'joint6'};

msg.Position = [0, 0, 0, 0, 0, 0];

% Publish commands

send(jointPub, msg);

```
```

This snippet illustrates how MATLAB can control a real robot in operational environments, enabling seamless transition from simulation to physical deployment.
