Sample Biology Biochemistry Multiple Choice Questions with Explanations

Below are representative questions to help reinforce key concepts. Each question is followed by the correct answer and a detailed explanation.

Question 1:

Which of the following is the primary function of enzymes in biological systems?

- a) Provide energy for reactions
- b) Speed up chemical reactions without being consumed
- c) Store genetic information
- d) Act as structural components of cells

Answer: b) Speed up chemical reactions without being consumed

Explanation:

Enzymes are biological catalysts that accelerate chemical reactions by lowering activation energy. They are not consumed in the reactions they catalyze, allowing a single enzyme molecule to facilitate multiple reactions. Options a), c), and d) refer to other biological molecules or functions, but the primary role of enzymes is catalysis.

Question 2:

Which biomolecule is primarily responsible for storing genetic information?

- a) Carbohydrates
- b) Lipids
- c) Proteins
- d) Nucleic acids

Answer: d) Nucleic acids

Explanation:

Nucleic acids, such as DNA and RNA, carry genetic information essential for inheritance and cellular function. Carbohydrates and lipids serve as energy sources and structural components, while proteins perform a wide range of functions but do not store genetic information.

Question 3:

During the process of glycolysis, which molecule is the end product?

- a) Pyruvate
- b) Acetyl-CoA
- c) Lactic acid
- d) Ethanol

Answer: a) Pyruvate

Explanation:

Glycolysis is the breakdown of glucose into two molecules of pyruvate. Pyruvate then enters further metabolic pathways such as the citric acid cycle or fermentation, depending on cellular conditions.

Question 4:

- a) Glycerol backbone with three fatty acids
- b) Glycerol backbone with two fatty acids and a phosphate group
- c) A single fatty acid chain attached to a glycerol
- d) A steroid nucleus with four fused rings

Answer: b) Glycerol backbone with two fatty acids and a phosphate group

Explanation:

Phospholipids consist of a glycerol backbone, two fatty acid chains, and a phosphate group. This structure forms the bilayer of cell membranes, providing fluidity and barrier functions.

Question 5:

In DNA, which base pairs with adenine?

- a) Cytosine

b) Guanine

c) Thymine

d) Uracil

Answer: c) Thymine

Explanation:

In DNA, adenine pairs specifically with thymine via two hydrogen bonds. This complementary base pairing is fundamental to DNA structure and replication.
