ANSYS 14 Tutorial Solid Fluid Two Way: An In-Depth Guide to Coupled Fluid-Structure Interaction Analysis

Introduction

In the realm of engineering simulations, the ability to accurately model and analyze the interaction between fluids and solids is paramount. ANSYS 14, a venerable platform in finite element analysis (FEA), introduces users to sophisticated capabilities for coupled solid-fluid analysis, often referred to as two-way fluid-structure interaction (FSI). This tutorial aims to demystify the process of setting up, executing, and interpreting a two-way FSI simulation within ANSYS 14, providing engineers and analysts with a comprehensive understanding of this powerful feature.

Understanding Solid-Fluid Two-Way Coupling in ANSYS 14

What is Two-Way Fluid-Structure Interaction?

Two-way FSI refers to simulations where both the fluid flow and solid deformation influence each other dynamically. Unlike one-way FSI, where the fluid affects the structure without reciprocal feedback, two-way coupling considers the mutual influence, resulting in more realistic and complex behavior modeling.

Key characteristics:

- Bidirectional influence: Fluid forces deform the solid; deformed solids alter the flow field.
- Dynamic interactions: Changes evolve over time, capturing transient phenomena.
- Applications: Aerospace (aeroelasticity), biomedical devices (heart valve dynamics), civil engineering (bridge aerodynamics), and more.

Why Use ANSYS 14 for Two-Way FSI?

ANSYS 14 provides integrated tools and modules that facilitate coupled analysis without necessitating third-party software. Its capabilities include:

- Embedded fluid and structural solvers.
- Data transfer interfaces for mesh mapping.
- Time-dependent analysis features for transient FSI.
- User-defined scripting for customization.

Setting Up a Two-Way FSI Simulation in ANSYS 14

- Preprocessing: Geometry and Mesh Preparation

a. Geometry Creation

Begin by defining the geometries of both the fluid and solid domains. For example, in a simple pipe with a flexible section:

- Solid domain: Flexible pipe wall.
- Fluid domain: Internal flow within the pipe.

b. Meshing

- Generate high-quality, conformal meshes at the interface to ensure accurate data transfer.
- Use finer mesh densities at the interface regions where the interaction is most critical.
- Consider mesh compatibility to reduce interpolation errors during solution transfer.

Assign appropriate physical properties:

- Solid: Young's modulus, Poisson's ratio, density.
- Fluid: Density, viscosity, and thermal properties if heat transfer is involved.
- Setting Boundary Conditions
 - Fluid domain: inlet velocity or pressure, outlet pressure, wall conditions.
 - Solid domain: fixed supports or constraints, initial deformation states.
 - Ensure boundary conditions do not artificially restrict the physical behavior of the system.

Implementing the Two-Way Coupling

- Selecting the Coupling Method

ANSYS 14 employs a partitioned approach, typically integrating Fluent (fluid solver) with Mechanical (structural solver). The coupling involves:

- Data transfer: Fluid forces to structure and structural displacements back to fluid.
