Sample Checkpoint Science 2 Question and Answer

Question:

Explain the process of photosynthesis and why it is vital for life on Earth.

Sample Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose. This process primarily occurs in the chloroplasts of plant cells, which contain the pigment chlorophyll. During photosynthesis, carbon dioxide (CO₂) from the atmosphere and water (H₂O) from the soil are used to produce glucose (C₆H₁₂O₆) and oxygen (O₂) as a byproduct. The overall simplified chemical equation for photosynthesis is:

Photosynthesis is vital for life on Earth because it produces oxygen necessary for most living organisms to breathe and forms the base of the food chain by creating organic compounds that other organisms consume. Without photosynthesis, the planet's atmosphere would lack sufficient oxygen, and the food supply for heterotrophic organisms would diminish, leading to the collapse of ecosystems.

Strategies for Mastering Checkpoint Science 2

Consistent Revision

Regularly review key concepts to reinforce understanding. Create summaries, flashcards, or mind maps for quick recall.

Practice Past Questions

Attempt previous exam questions or sample tests to familiarize yourself with question formats and time management.
