Sample Question Walkthroughs and Solutions

Example 1: Calculating the Mean and Median

Question: A dataset represents the ages of students in a class: 18, 20, 22, 20, 19, 21, 20. Find the mean and median age.

Solution:

Step 1: Find the mean:

\[

$$\text{Mean} = \frac{18 + 20 + 22 + 20 + 19 + 21 + 20}{7} = \frac{140}{7} = 20$$

\]

Step 2: Find the median:

- Arrange data in order: 18, 19, 20, 20, 20, 21, 22
- Since there are 7 data points, the median is the 4th value:

Median = 20

Key takeaway: Remember that median is the middle value when data is ordered, and mean is the sum divided by the number of data points.

Example 2: Probability Calculation with Conditional Probability

Question: In a class, 60% of students passed the statistics midterm. Among those who passed, 70% studied daily. If a student is randomly selected, what is the probability they studied daily given they passed?

Solution:

Step 1: Define events:

- (P) : Student passed
- (D) : Student studied daily

Given:

- $P(P) = 0.6$
- $P(D|P) = 0.7$

The question asks for $P(D|P)$, which is directly provided as 0.7.

Answer: The probability that a student studied daily given they passed is 70%.

Note: This highlights the importance of understanding conditional probability and how to interpret given information.

Example 3: Using the Normal Distribution

Question: The heights of adult males are normally distributed with a mean of 70 inches and a standard deviation of 3 inches. What percentage of males are taller than 74 inches?

Solution:

Step 1: Calculate the z-score:

[

$$z = \frac{74 - 70}{3} = \frac{4}{3} \approx 1.33$$

]

Step 2: Find the area to the right of $(z = 1.33)$ using a standard normal table or calculator:

$$- P(Z > 1.33) \approx 0.0918$$

Step 3: Convert to percentage:

$[$

$$0.0918 \times 100\% \approx 9.18\%$$

$]$

Answer: Approximately 9.18% of adult males are taller than 74 inches.

Tips for Success on MathXL Statistics Midterms
