Sample Problem Breakdown

Problem Statement:

A piston-cylinder device contains saturated water vapor at 200 kPa. It undergoes an adiabatic expansion until the pressure drops to 100 kPa. Determine the work done during this process, assuming an idealized process.

Step-by-Step Solution Approach:

- Identify initial and final states:

- Calculate initial entropy (s_1) :
- From tables at 200 kPa.

- Find final specific volume (v_2) :
- Use the fact that for an isentropic process, $(s_2 = s_1)$.
- Compute work done:
- For a reversible adiabatic process:

$$W =$$

$$W = P_{\text{avg}} (V_2 - V_1)$$

$$W =$$

- Alternatively, use the change in internal energy and the first law, considering the specific heats or property relations.

- Final check:

- Ensure the computed work makes sense physically (e.g., negative sign indicates work done by the system).

Understanding it helps students grasp fundamental limits of thermodynamic efficiency and serves as a benchmark for real-world engine performance. How can I effectively analyze phase change problems in ME2202? Use property tables or diagrams to determine specific volumes, enthalpies, and entropies during phase changes. Apply energy and mass balances carefully, and consider the use of quality (x) to relate saturated liquid and vapor states for accurate calculations. What are common mistakes to avoid when solving thermodynamics problems in ME2202? Common mistakes include mixing units, overlooking boundary conditions, neglecting the direction of heat and work transfer, and failing to verify the physical plausibility of results. Double-check assumptions, use consistent units, and verify results against known limits or cycles.
