Common Oracle SQL Exam Questions with Answers

Below are some frequently encountered questions in Oracle SQL certification exams, along with

detailed answers and explanations. These samples are representative of the types of questions you might encounter.

Question 1: What is the purpose of the `NVL` function in Oracle SQL?

Options:

- A) To replace NULL values with a specified value
- B) To check if a value is NULL
- C) To concatenate two strings
- D) To convert data types

Answer: A) To replace NULL values with a specified value

Explanation: The `NVL` function in Oracle SQL is used to substitute a value when a NULL is encountered. For example:

```
```sql
```

```
SELECT employee_name, NVL(commission_pct, 0) AS commission
```

```
FROM employees;
```

```
```
```

In this query, any NULL `commission\_pct` values are replaced with 0. This function is essential for data cleaning and ensuring calculations do not result in NULLs.

Question 2: Which clause is used to filter records in Oracle SQL?

Options:

- A) WHERE
- B) HAVING
- C) GROUP BY

D) ORDER BY

Answer: A) WHERE

Explanation: The `WHERE` clause is used to specify conditions that filter records in a SELECT statement. It retrieves only the rows that meet the specified criteria. For example:

```
```sql
```

```
SELECT FROM employees WHERE department_id = 10;
```

```
```
```

This query fetches all employees in department 10.

Question 3: How does the `JOIN` operation work in Oracle SQL?

Options:

A) Combines columns from multiple tables based on a related column

B) Deletes rows from a table

C) Creates a new table from existing tables

D) Updates data in multiple tables simultaneously

Answer: A) Combines columns from multiple tables based on a related column

Explanation: `JOIN` allows you to retrieve data spanning multiple tables by establishing a relationship between them. The most common types are `INNER JOIN`, `LEFT JOIN`, `RIGHT JOIN`, and `FULL OUTER JOIN`. For example:

```
```sql
```

```
SELECT e.employee_id, e.employee_name, d.department_name
```

```
FROM employees e
```

```
JOIN departments d ON e.department_id = d.department_id;
```

...

This query combines data from `employees` and `departments` based on the matching `department\_id`.

#### Question 4: What is the purpose of the `GROUP BY` clause?

Options:

- A) To aggregate data based on one or more columns
- B) To filter grouped data
- C) To order data in ascending or descending order
- D) To limit the number of rows returned

Answer: A) To aggregate data based on one or more columns

Explanation: The `GROUP BY` clause groups rows that have the same values in specified columns, often used with aggregate functions like `SUM`, `AVG`, `COUNT`. For example:

```
```sql
```

```
SELECT department_id, COUNT() AS employee_count
```

```
FROM employees
```

```
GROUP BY department_id;
```

```
```
```

This groups employees by department and counts them.

#### Question 5: Which function is used to generate a sequence of numbers in Oracle SQL?

Options:

- A) `ROWNUM`

B) `SEQUENCE.NEXTVAL`

C) `RANGE`

D) `GENERATE\_SERIES`

Answer: B) `SEQUENCE.NEXTVAL`

Explanation: In Oracle, sequences are database objects that generate unique numbers. `SEQUENCE.NEXTVAL` retrieves the next value in a sequence. For example:

```
```sql
```

```
CREATE SEQUENCE emp_seq START WITH 1 INCREMENT BY 1;
```

```
INSERT INTO employees (employee_id, name)
```

```
VALUES (emp_seq.NEXTVAL, 'John Doe');
```

```
```
```

Sequences are used for generating primary key values.

- Explain the difference between Physical Layer, Business Model Layer, and Presentation Layer in OBIEE.

Answer:

- Physical Layer: Represents the actual data sources, like tables, views, or external databases. It defines the physical database objects.

- Business Model Layer: Provides an abstracted, logical view of the data. It includes logical tables, columns, and joins, simplifying complex physical data for end-users.

- Presentation Layer: The user-facing layer where logical columns and tables are organized for reporting and analysis. It presents a user-friendly view of data.

- What are the different types of joins in OBIEE?

Answer:

OBIEE supports various join types, including:

- Inner Join: Returns records with matching values in both tables.

- Outer Join (Left, Right, Full): Returns all records from one table and matched records from the other.

- Compound Join: Combines multiple join conditions.

- Complex Join: Used for many-to-many relationships.

Advanced OBIEE Interview Questions and Answers

- What is a Logical Table Source (LTS) in OBIEE?

Answer:

A Logical Table Source (LTS) is a logical representation of data in the Business Model Layer that maps to one or more physical sources in the Physical Layer. It allows multiple physical sources to

combine into a single logical table, enabling data from different sources to be used seamlessly in reports.

- How do you handle complex joins in OBIEE?

- Results Cache: Stores query results.
- Physical Cache: Stores data at the database level.
- Dashboard Cache: Stores entire dashboards.

When a user runs a report, OBIEE first checks the cache. If the data exists and is valid, it serves it from cache, reducing load time.

Security and User Management in OBIEE

- How is security managed in OBIEE?

Answer:

OBIEE security is managed through:

- Authentication: Verifies user identity (LDAP, Database, etc.).
- Authorization: Controls user access to reports, dashboards, and data.

QuestionAnswer What is OBIEE and what are its main components? OBIEE (Oracle Business Intelligence Enterprise Edition) is a comprehensive suite of enterprise business intelligence tools. Its main components include BI Server (logical data access layer), BI Presentation Layer (user interface), BI Scheduler (report scheduling), BI Answers (ad-hoc reporting), BI Dashboards (visual dashboards), and BI Publisher (report publishing). How does the OBIEE architecture work? OBIEE architecture involves multiple layers: Data sources (databases), the BI Server which processes requests and manages logical data modeling, the Presentation Layer for user interaction, and the Web Server that hosts the BI portal. Users create reports and dashboards that query data through the BI Server, which retrieves and processes data from underlying sources. What is a Repository (RPD) in OBIEE and how is it structured? The RPD (Repository) is a metadata repository that defines logical data models, physical data sources, and security settings. It has three main layers: Physical Layer (connects to data sources), Business Model and Mapping Layer (logical models of data), and Presentation Layer (user-visible objects). Explain the difference between a Logical Table and a Physical Table in OBIEE. A Physical Table represents the actual table in the database, while a Logical Table is an abstraction used in the Business Model layer to define how data is presented to users. Logical Tables are mapped to Physical Tables and can combine data from multiple sources. What are aggregate tables in OBIEE, and why are they used? Aggregate tables contain pre-summarized data at various levels of aggregation. They improve query performance by reducing

the amount of data processed during report execution, especially for large datasets or complex calculations. How do you troubleshoot performance issues in OBIEE? Troubleshooting involves analyzing query logs, using the BI Server Diagnostics, checking for inefficient SQL queries, optimizing the RPD, creating aggregate tables, tuning the database, and reviewing report design for performance bottlenecks. What is a Prompt in OBIEE and how is it used? A Prompt is an interactive filter that allows users to select values dynamically at runtime, which then filters the data displayed in reports or dashboards. Prompts enhance report interactivity and user control over data views. Can you explain the difference between 'Session Variables' and 'Repository Variables' in OBIEE? Repository Variables are static variables defined in the RPD used for configuration or setting default values. Session Variables are dynamic variables set at runtime for individual user sessions, often used to personalize reports or control access.
