Neurobiology of Drugs and the Brain

Brain Structures Involved in Substance Use

The brain's reward circuitry plays a pivotal role in the development of addiction. Key structures include:

- **Nucleus Accumbens:** Central to the reward pathway, mediates the pleasurable effects of drugs.
- **Ventral Tegmental Area (VTA):** Produces dopamine neurons that project to the nucleus accumbens and other regions.
- **Prefrontal Cortex:** Involved in decision-making, impulse control, and assessing consequences.
- **Hippocampus:** Critical for memory formation and contextual learning related to drug cues.

Neurochemical Systems Affected by Drugs

Different classes of drugs target specific neurochemical pathways, including:

- **Dopamine:** Central to reward and pleasure; drugs like cocaine and amphetamines increase dopamine levels.
- **Serotonin:** Modulates mood, perception, and cognition; affected by hallucinogens such as LSD.
- **GABA:** Inhibitory neurotransmitter; alcohol enhances GABA activity, leading to sedative effects.
- **Glutamate:** Excitatory neurotransmitter; involved in neuroplasticity and learning.

Pharmacology and Mechanisms of Action

Categories of Psychoactive Drugs

The textbook categorizes drugs based on their primary effects and mechanisms, including:

- **Stimulants:** Increase alertness and energy (e.g., cocaine, methamphetamine).
