#### Reflection of Light

Reflection is a fundamental concept where light bounces off a surface. According to the laws of reflection, the angle of incidence equals the angle of reflection, measured relative to the normal (perpendicular) to the surface.

#### Types of Mirrors and Their Properties

- Plane Mirror:

Produces virtual, upright, and laterally inverted images at the same distance behind the mirror.

- Concave Mirror:

Converging mirror that can produce real or virtual images depending on object position.

- Convex Mirror:

Diverging mirror producing virtual, diminished images.

Applications include vehicle side mirrors, shaving mirrors, and focusing devices.

#### Image Formation by Mirrors

Understanding the principles of image formation involves ray diagrams, principal focus, and the mirror formula:

$$1/f = 1/v + 1/u$$

Where:

- f is the focal length
- v is the image distance

- $u$  is the object distance

## Refraction and Lenses

Refraction occurs when light passes from one medium to another with a different refractive index, causing bending.

### Snell's Law

Mathematically expressed as:

$$n_1 \sin \theta_1 = n_2 \sin \theta_2$$

This law explains the bending of light at interfaces, crucial for understanding lenses and optical fibers.

## Lenses and Image Formation

Lenses are transparent objects that refract light to form images. They are classified as:

- Convex (Converging) Lenses

Form real, inverted images when the object is beyond the focus; virtual and magnified images when within the focus.

- Concave (Diverging) Lenses

Always produce virtual, erect, and diminished images.

The lens formula:

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$$

and the magnification formula:

$$M = \frac{v}{u}$$

are essential tools for calculations.
