image fusion using wavelet transform matlab code has become an essential technique in image processing, especially for applications such as medical imaging, remote sensing, and surveillance. Combining multiple images to produce a single, more informative image allows for better analysis and decision-making. Wavelet transform-based image fusion leverages the ability of wavelets to analyze images at different scales and resolutions, making it highly effective in preserving both the spatial and frequency information of source images. This article provides a comprehensive overview of how to implement image fusion using wavelet transform in MATLAB, including step-by-step code examples, underlying principles, and practical considerations.

Understanding Image Fusion and Wavelet Transform

What is Image Fusion?

Image fusion is the process of integrating multiple images of the same scene into a single image that contains more useful information than any individual source image. The goal is to combine the salient features of each image, such as textures, edges, or specific spectral information, to enhance the overall image quality for analysis or visualization.

Why Use Wavelet Transform for Image Fusion?

Wavelet transform provides a multi-resolution analysis of images, decomposing them into different frequency components at various scales. This property makes wavelets particularly suitable for image fusion because:

- It captures both spatial and frequency information effectively.
- It enables selective fusion of high-frequency details (edges, textures) and low-frequency components (smooth regions).
- It reduces artifacts and preserves important features during fusion.

Implementing Image Fusion Using Wavelet Transform in MATLAB

Prerequisites

Before diving into the code, ensure you have:

- MATLAB installed with the Wavelet Toolbox.
- Source images to fuse, preferably of the same size and alignment.

Step-by-Step MATLAB Code for Wavelet-Based Image Fusion

1. Load the Source Images

```
```matlab

% Read two source images

img1 = imread('image1.png');

img2 = imread('image2.png');

% Convert to grayscale if they are RGB

if size(img1,3) == 3

img1 = rgb2gray(img1);

end

if size(img2,3) == 3

img2 = rgb2gray(img2);

end

% Ensure images are of the same size

assert(isequal(size(img1), size(img2)), 'Images must be of the same size');

```
```

2. Perform Wavelet Decomposition

```
```matlab

% Choose wavelet type and decomposition level
```

```
waveletType = 'sym4'; % Symlet wavelet

decompositionLevel = 2;

% Decompose both images

[LL1, LH1, HL1, HH1] = dwt2(img1, waveletType);

[LL2, LH2, HL2, HH2] = dwt2(img2, waveletType);

...
```

### 3. Fuse the Wavelet Coefficients

There are various fusion rules; one common approach is to take the maximum absolute value from the detail coefficients and average or select the low-frequency component.

```
```matlab

% Fuse low-frequency coefficients by averaging

LL_fused = (LL1 + LL2) / 2;

% Fuse detail coefficients by selecting the maximum absolute value

LH_fused = max(abs(LH1), abs(LH2)) . sign(LH1 + LH2);

HL_fused = max(abs(HL1), abs(HL2)) . sign(HL1 + HL2);

HH_fused = max(abs(HH1), abs(HH2)) . sign(HH1 + HH2);

...
```

4. Reconstruct the Fused Image

```
```matlab

% Reconstruct the fused image using inverse DWT

fusedImage = idwt2(LL_fused, LH_fused, HL_fused, HH_fused, waveletType);
```

```
% Convert to uint8 for display
```

```
fusedImage = uint8(fusedImage);
```

```
...
```

## 5. Display and Save the Result

```
```matlab
```

```
% Display images
```

```
figure;
```

```
subplot(1,3,1); imshow(img1); title('Image 1');
```

```
subplot(1,3,2); imshow(img2); title('Image 2');
```

```
subplot(1,3,3); imshow(fusedImage); title('Fused Image');
```

```
% Save the fused image
```

```
imwrite(fusedImage, 'fused_image.png');
```

```
...
```

Advanced Techniques and Optimization

Multi-Level Wavelet Decomposition

For more detailed fusion, increase the decomposition level:

```
```matlab
```

```
decompositionLevel = 3; % or higher
```

```
% Perform multi-level decomposition
```

```
[cA, cH, cV, cD] = dwt2(img, waveletType, 'Level', decompositionLevel);
```

```
...
```

This allows capturing features at various scales, improving the quality of the fused image.
