Understanding the Architecture of Microsoft Dynamics 2013

Before diving into programming specifics, it's crucial to grasp the architecture of Dynamics 2013, which influences how developers approach customization and integration.

Core Components of Dynamics 2013

- **Server-Side Components:** These include the Microsoft Dynamics CRM server, which hosts the core application logic, business rules, and data storage.
- **Client-Side Components:** Web applications, Outlook clients, and mobile interfaces that interact with the server.

- Web Services: Dynamics 2013 exposes a rich set of web services, primarily the Organization Service, which facilitates CRUD operations and complex queries.
- Customization Framework: Built-in tools and APIs for customizing entities, forms, views, and workflows.

Development Environment Setup

To start programming in Dynamics 2013, you need:

- Microsoft Visual Studio: For developing custom plugins, workflows, and integrations.
- Microsoft Dynamics SDK: Provides assemblies, documentation, and tools.
- SQL Server Management Studio: For direct database access (though direct database modification is generally discouraged).

Key Programming Techniques in Microsoft Dynamics 2013

Understanding the primary methods of customization and extension is vital for effective Dynamics development.

1. Developing Plugins

Plugins are server-side components that run in response to specific events, such as create, update, or delete operations on records.

Steps to develop a plugin:

- Create a new Class Library project in Visual Studio.
- Reference the necessary assemblies (`Microsoft.Xrm.Sdk.dll`, `Microsoft.Crm.Sdk.Proxy.dll`).
- Implement the `IPlugin` interface.
- Register the plugin using the Plugin Registration Tool or through the SDK.

Sample plugin outline:

```
```csharp
```

```
public class SamplePlugin : IPlugin
```

```
{
```

```
public void Execute(IServiceProvider serviceProvider)

{

// Obtain the execution context

IPluginExecutionContext context =
(IServiceProvider)serviceProvider.GetService(typeof(IPluginExecutionContext));

// Obtain the organization service

IOrganizationServiceFactory factory =
(IOrganizationServiceFactory)serviceProvider.GetService(typeof(IOrganizationServiceFactory));

IOrganizationService service = factory.CreateOrganizationService(context.UserId);

// Your logic here

}

}

...

```

Common use cases:

- Data validation
- Automated record updates
- Integration triggers

## 2. Creating Custom Workflows

Workflows automate business processes and can be configured using the Dynamics CRM workflow designer. For advanced customization, custom workflow activities can be developed.

Developing custom workflow activities:

- Create a class library project.
- Reference the SDK assemblies.

- Derive from `CodeActivity``.
- Implement the `Execute`` method.

Sample custom workflow activity:

```
```csharp

public class SampleWorkflowActivity : CodeActivity

{

protected override void Execute(CodeActivityContext context)

{

// Workflow logic

}

}

```
```

### 3. Building Web Resources

Web resources include HTML, JavaScript, images, and other files used to customize forms and views.

Tips for effective web resource programming:

- Use JavaScript for client-side validation and dynamic UI updates.
- Store reusable scripts as web resources.
- Register web resources on forms for enhanced interactivity.

### 4. Using the SDK and APIs

The SDK provides a comprehensive set of APIs for CRUD operations, querying data, and managing entities.

Key APIs:

- Organization Service: For standard operations.
- QueryExpression: For complex queries.
- RetrieveMultiple: For fetching collections of records.
