Physics 12 Unit Circular Motion Answers

Understanding the concepts and solving problems related to circular motion are essential components of the Physics 12 curriculum. The unit on circular motion explores how objects move along a circular path and the forces involved in such motion. For students preparing for exams or seeking to deepen their understanding, comprehensive answers to typical questions and problems can be invaluable. This article provides detailed explanations, problem-solving strategies, and key concepts related to Physics 12 Unit Circular Motion, serving as a useful guide to mastering this topic.

Introduction to Circular Motion

Circular motion occurs when an object moves along a circular path. The motion can be uniform, where the object's speed remains constant, or non-uniform, where the speed varies. Despite the difference in speed, the object experiences acceleration directed toward the center of the circle, known as centripetal acceleration.

Key Concepts in Circular Motion

- **Centripetal Force:** The force directed toward the center of the circle that keeps the object moving along the circular path.
- **Centripetal Acceleration:** The acceleration toward the center, given by $a_c = \frac{v^2}{r}$, where v is velocity and r is the radius.
- **Period (T):** The time taken for one complete revolution.
- **Frequency (f):** The number of revolutions per second, related to period by $f = \frac{1}{T}$.
- **Angular Velocity (ω):** The rate of change of angular displacement, given by $\omega = \frac{2\pi}{T}$.

Common Questions and Answers in Circular Motion

Understanding typical questions and their solutions is fundamental for mastering the unit. Here are some common problems with detailed answers.

Question 1: Derive the expression for centripetal acceleration.

Answer:

Centripetal acceleration (a_c) is the acceleration experienced by an object moving along a circular path at a constant speed. It points toward the center of the circle and is given by:

$$a_c = \frac{v^2}{r}$$

where:

- v is the linear velocity,
- r is the radius of the circular path.

Derivation:

- The object covers an arc length $s = r\theta$, where θ is the angular displacement.
- The velocity v relates to s and time t as $v = \frac{s}{t}$.
- The angular velocity ω is $\omega = \frac{\theta}{t}$, so $v = r\omega$.
- Differentiating $v = r\omega$ with respect to time:

$$a_c = \frac{dv}{dt} = r \frac{d\omega}{dt}$$

Since ω is constant in uniform circular motion, the centripetal acceleration can also be expressed in terms of v :

- Since ω is constant in uniform circular motion, the centripetal acceleration can also be expressed in terms of v :

$$a_c = \frac{v^2}{r}$$

Question 2: How is the centripetal force related to the mass of the object?

Answer:

The centripetal force (F_c) required to keep an object moving in a circle is directly proportional to its mass (m). It is given by:

$$F_c = m a_c = m \frac{v^2}{r}$$

]

This means that for a given speed and radius, a more massive object requires a larger force to maintain circular motion.

Question 3: Calculate the period of a satellite revolving around the Earth at a radius of (7×10^6) meters with a velocity of (7.5×10^3) m/s.

Answer:

Using the formula for period:

$$T = \frac{2\pi r}{v}$$

]

Substitute the known values:

$$T = \frac{2\pi \times 7 \times 10^6}{7.5 \times 10^3} \approx \frac{43.98 \times 10^6}{7.5 \times 10^3} \approx 5851.2 \text{ seconds}$$

]

which is approximately 1 hour 37 minutes.

Important Formulas in Circular Motion

A solid grasp of the key formulas is essential for solving problems efficiently.

Linear and Angular Quantities

- Velocity: $(v = r \omega)$
- Angular velocity: $(\omega = \frac{2\pi}{T})$
- Period: $(T = \frac{2\pi r}{v})$

Forces and Acceleration

- Centripetal acceleration: $(a_c = \frac{v^2}{r})$
- Centripetal force: $(F_c = m \frac{v^2}{r})$

Applying Circular Motion Concepts to Real-World Problems

Understanding how to apply theoretical concepts to practical scenarios is vital for success. Here are some steps and tips.

Step-by-Step Problem-Solving Approach

- Identify the known quantities: radius, velocity, mass, period, etc.
- Determine what the question asks for: force, acceleration, period, angular velocity, etc.
- Write down relevant formulas based on the known quantities.
- Substitute the known values into the formulas.
- Calculate and interpret the result, checking units and reasonableness.

Example Problem:

A car of mass 1500 kg is moving around a circular track with a radius of 500 meters at a speed of 20 m/s. Find the centripetal force acting on the car.

Solution:

- Known: $(m = 1500, \text{kg})$, $(r = 500, \text{m})$, $(v = 20, \text{m/s})$
- Use $(F_c = m \frac{v^2}{r})$:

$\backslash$

$$F_c = 1500 \times \frac{(20)^2}{500} = 1500 \times \frac{400}{500} = 1500 \times 0.8 = 1200 \text{ N}$$

\\

Answer: The centripetal force required is 1200 Newtons.

Common Mistakes to Avoid

- Confusing linear velocity (v) with angular velocity (ω) . Remember $(v = r \omega)$.
- Forgetting to convert units when necessary.
- Mixing up centripetal force with other forces like friction or gravity; always identify the net force directed toward the center.
- Assuming uniform circular motion when acceleration or force may vary.

Practice Problems for Mastery

Practicing different types of questions enhances understanding. Here are some exercises:

- Calculate the angular velocity of a wheel rotating at 120 revolutions per minute (rpm).

Introduction to Circular Motion in Physics 12

Circular motion refers to the movement of an object along a circular trajectory. Unlike linear motion, where velocity and acceleration are in straight lines, circular motion involves continuous change in direction, hence acceleration directed toward the center of the circle, known as centripetal acceleration.

Why Is Circular Motion Important?

- It appears in various real-world phenomena: planets orbiting stars, cars turning on a curve, electrons in magnetic fields, and amusement park rides.
- Understanding circular motion is crucial for designing safe transportation systems, understanding astrophysics, and exploring fundamental forces.

Core Concepts in Circular Motion

Before diving into specific solutions, it's vital to understand the foundational principles:

- Velocity in Circular Motion

- Tangential velocity (v): The speed of the object along the circular path.
- Relation to angular velocity (ω): $v = r \times \omega$
- Direction: Always tangent to the circle at any point.

- Centripetal Acceleration and Force

- Centripetal acceleration (a_c): $a_c = \frac{v^2}{r}$
- Centripetal force (F_c): $F_c = m \times a_c = \frac{m v^2}{r}$

- Period and Frequency

- Period (T): Time taken for one complete revolution.
- Frequency (f): Number of revolutions per second, $f = \frac{1}{T}$.

Common Types of Questions and How to Approach Them

In the Physics 12 Unit Circular Motion answers, students encounter a variety of problems. Below are typical question types with strategies to solve them.

- Calculating Velocity and Acceleration

Sample question:

A car moves around a circular track of radius 50 meters at a constant speed. If the period of revolution is 20 seconds, what is the velocity and centripetal acceleration?

Solution approach:

- Find velocity: $v = \frac{2\pi r}{T}$
- Calculate acceleration: $a_c = \frac{v^2}{r}$

Step-by-step:

$$v = \frac{2\pi \times 50}{20} = \frac{100\pi}{20} = 5\pi \approx 15.7, \text{ m/s}$$

$$- \left(a_c = \frac{(15.7)^2}{50} \approx \frac{246.5}{50} \approx 4.93, \text{ m/s}^2 \right)$$

- Determining Centripetal Force

Sample question:

An object of mass 2 kg moves in a circle of radius 10 meters at a speed of 8 m/s. What is the centripetal force?

Solution:

$$- \text{Use } \left(F_c = \frac{m v^2}{r} \right)$$

$$- \text{Calculation: } \left(F_c = \frac{2 \times 8^2}{10} = \frac{2 \times 64}{10} = \frac{128}{10} = 12.8, \text{ N} \right)$$

- Energy and Circular Motion

Sample question:

A roller coaster car of mass 500 kg moves from a height of 30 meters. Neglecting friction, what is its speed at the bottom of the track?

Solution:

- Use conservation of energy: potential energy at the top converts into kinetic energy at the bottom.

$$- \left(mgh = \frac{1}{2} m v^2 \right)$$

$$- \text{Simplify: } \left(gh = \frac{1}{2} v^2 \right)$$

$$- \left(v = \sqrt{2gh} \right)$$

$$- \text{Calculation: } \left(v = \sqrt{2 \times 9.8 \times 30} \approx \sqrt{588} \approx 24.3, \text{ m/s} \right)$$

Advanced Problems and Real-World Applications

- Banked Curves and Friction

Question:

A car of mass 1000 kg takes a turn on a banked curve of radius 50 m at a speed of 20 m/s. The banking angle is θ . Find θ such that no friction is needed.

Approach:

- Use the banked curve formula: $\tan \theta = \frac{v^2}{r g}$
- Calculation: $\tan \theta = \frac{20^2}{50 \times 9.8} = \frac{400}{490} \approx 0.816$
- $\theta = \arctan(0.816) \approx 39.1^\circ$

- Satellites and Orbital Motion

Question:

_What is the orbital speed of a satellite 300 km above Earth's surface? (Earth's radius $r_E = 6371$ km, Earth's mass $M_E = 5.97 \times 10^{24}$ kg)_

Approach:

- Total radius: $r = 6371 + 300 = 6671$ km, $r = 6.671 \times 10^6$ m
- Use gravitational force for centripetal force: $\frac{G M m}{r^2} = \frac{m v^2}{r}$
- Simplify: $v = \sqrt{\frac{G M}{r}}$
- Calculation:

$$v = \sqrt{\frac{6.674 \times 10^{-11} \times 5.97 \times 10^{24}}{6.671 \times 10^6}}$$

$$v \approx \sqrt{\frac{3.986 \times 10^{14}}{6.671 \times 10^6}} \approx \sqrt{5.977 \times 10^7} \approx 7730 \text{ m/s}$$

Question What is the main concept behind circular motion in physics? Circular motion involves an object moving along a curved path or circle, characterized by a constant or variable speed, with the direction of velocity continuously changing, resulting in acceleration directed towards the center of the circle. How is centripetal force calculated in uniform circular motion? Centripetal force is calculated using the formula $F_c = (m v^2) / r$, where m is the mass of the object, v is its tangential velocity, and r is the radius of the circle. What is the difference between uniform and non-uniform circular motion? Uniform circular motion involves an object moving at a constant speed

along a circle, with a constant magnitude of velocity but changing direction. Non-uniform circular motion involves changes in speed, causing variations in acceleration and force. How do you find the period and frequency of an object in circular motion? The period (T) is the time taken for one complete revolution, and the frequency (f) is the number of revolutions per second. They are related by $f = 1 / T$. What role does tension play in circular motion, especially in a conical pendulum? In a conical pendulum, tension in the string provides the centripetal force necessary to keep the mass moving in a circle. It has components balancing gravity and providing the inward force for circular motion. How is angular velocity related to linear velocity in circular motion? Linear velocity v is related to angular velocity ω by the equation $v = r \omega$, where r is the radius of the circle. What is the significance of the acceleration in circular motion? Acceleration in circular motion, called centripetal acceleration, always points toward the center of the circle and is given by $a_c = v^2 / r$, responsible for changing the direction of the velocity vector. How do you analyze non-uniform circular motion involving tangential acceleration? In non-uniform circular motion, both tangential acceleration (a_t) and centripetal acceleration are considered. The tangential acceleration affects the speed, while centripetal acceleration maintains the circular path. Kinematic equations are used to analyze the motion. Why is conservation of angular momentum important in circular motion problems? Conservation of angular momentum states that if no external torque acts on a rotating body, its angular momentum remains constant. This principle helps analyze systems like spinning skaters or planets in orbit during circular motion. What are real-world examples of circular motion studied in physics? Examples include satellites orbiting Earth, car turning on a curve, spinning amusement park rides, and electrons moving in magnetic fields, all illustrating principles of circular motion.
